ANIMATION
IN 3 STEPS]

RDM TOOLS V2

[iEasy Rigging Tool for Maya!]

Install

Install: According to your operating system Copy RdM Tools v2 folder in:

- documents/maya/201X/scripts
- Users/nameUser/Library/Preferences/Autodesk/maya/201X/scripts/

Run: Now run this command in Python:

```
from RdMToolsV2.ShowUI import RdMV2UI
RdMV2_ui = RdMV2UI()
RdMV2_ui.show()
```

Or

```
from RdMToolsV2.ShowUI import RdMV2UI
RdMV2_ui = RdMV2UI()
RdMV2_ui.show()
```

"You can also open ShowUI.py from the scripts folder and run it (ctrl+enter)
For easy access create a icon in the shelf by drag and drop the code with the middle mouse!"

Change Icon: Right-click any item on a shelf, then elect Edit:
click on the "Icon Name" folder icon, choose the RDMTool.png icon, then save the shelf Editor and voila!!!.

1

Rigging Tools Tab

Renamer:

Rename the selected objects
creates a number after the name
Prefix put the text line as prefix for selection
Sufix put the text line as prefix for selection

Joint, Joint Ctrl, Controller, Grp are premade Sufixes
Left and right side put L_ or R_ As perfix for selection

Search replace in selection or in the herachy.

Joint Size:

A slider that controls the size of the joints.

Joint Hide:

Show/Hide transform axis of the joints, if selected only shows those, else shows everything.
Show/Hide Joints: Change the draw style from bone to none of all joints in the scene.

Orient Joints:

Select Joints and fast orient them in 2 different premade ways.

Constraints:

Constraints with or without maintain offset.

Hide Attrs:

Hide in the channel box the selected attributes
Reveal all the attributes in the channel box

IK/FK:

Select 3 joints chain (the chain must NOT have any parent or children) and create an IKFK Chain for them

Simple FK:

Select Joints and create a FK Chain (Custom Axis is X).

Add Twist:

Select 2 joints and creates a twist between them with the selected axis
Use Reverse for lower arm kind of twist and don't use it for upper arm kind of twist

Point on Poly:

Select a Face and connect a Locator to the mesh. It can have a joint if needed

Connect With Line:

Select 2 objects and connected with a curve

IKPlane Ref:

Select 2 objects and create a plane between them, ideally for creating IK systems

Controllers Tab

Curve Texts:

Select a font and create curves with the text (there is a warning sometimes, just ignore it ;D).

Create Sliders with curves:

Select the size (translate Y and X limits), use it with Negatives and or with square Shape. **The NAME MUST BE UNIQUE!!!**

Curves:

Create Curves with selected shape. You can select objects and create the curve on their positions wit or without parent constraints!

Mirror Behavior:

Create a group over the selected object to change their axis to the other side

World Mirror:

Move the selected object to the other side of the world in X axis.

Select objects and create an **Root and Auto** Groups above them (2 groups)
Select objects and create an **offset group** above them (1 group)

Change chapes from transform nodes
Add shapes from transform nodes.

Match Transforms:

Select the object you want to move and the desire position then match the transformations.

[AUTO-RIG]

Skinning Tab

Bind Skin: Simple bind skin for selected objects.

Skin Help: Select the angle and Create keyframes with rotations for easy skinning.

Copy skin Weights: Select two objects and copy the skinning.

Select joints from Skin Cluster: Select the joints from selections with skin clusters.

Joints Edit:

Turn on and move the bindend joints, turn of and save the changes.

Export Weight:

Export or import the weights maps (Don't use them, there are better ones online).

Mirror Skin Weights: Mirror skinning in X Axis (Closes component is the recommended)

A LOT OF TUTORIALS ONLINE REALLY EASY TO FOLLOW AND LEARN
