

Animo

A complete visual reference to every tool in Animo for Maya, what each tool does and when to reach for it.

Animo

Built by an animator, for animators.

What Animo Offers

A quick look at everything packed into the toolbar, grouped by what it's used for.

TRANSFER & LAYERS

- Copy animation from one scene to another
- Copy poses from one scene to another
- Animation layer tools

SELECTION & TWEEN

- Selection sets
- Animation sliders
- Fast arc tracker
- Camera-space arc tracker

SPACE & PIVOT

- Space switching
- Attribute space switching
- Temporary pivot tools
- Xform

OFFSET & STYLE

- Global offset
- Spider-Verse style stepped animation
- Animation repathing

TANGENTS & GRAPH EDITOR

- Graph Editor toolbar
- Nudge keys left & right

EXPORT, MIRROR & REVIEW

- Quick export and import objects
- Mirror pose & animation
- Multi-camera playblaster

POSE & KEY UTILITIES

- Fast baking
- Reset translate, rotate, scale, or all

And much more.

Contents

01 ● Transfer & Layers

Move animation between rigs and scenes, and merge layers fast.

02 ● Selection, Tween & Arcs

Build selection sets, blend poses, and check motion quality.

03 ● Space & Pivot

Switch spaces, align objects, and re-pivot poses without breaking animation.

04 ● Spacify

Animo's space-switching toolkit.

05 ● Xform & Align

How Animo's transform-copying and alignment tools work.

06 ● Offset & Reposition

Offset whole poses, restyle timing, and repath locomotion.

07 ● Twosify

Animo's temporary stepped animation tool.

08 ● Vectorify

Animo's repathing tool.

09 ● Tangents

Set curve interpolation across all keys or a selection.

10 ● Export, Mirror & Review

Move assets between scenes, mirror poses, and playblast for review.

11 ● Pose & Key Utilities

Everyday actions for resetting, baking, sharing and selecting keys.

12 ● Curve Cleanup

Trim, de-noise and de-clutter animation curves.

13 ● Application

Toolbar-level controls for Animo.

14 ● Animation Sliders

Drag-to-apply sliders for tweening, blending, scaling and offsetting keys.

01

Transfer & Layers

Move animation between rigs and scenes, and merge layers fast.

Anim Transfer

Copy animation or poses between characters, or even across different Maya scenes with ease.

- Transfer animation between rigs.
- Copy poses across scenes.
- Works with different character setups.

Keys Time

Save and restore your keyframe timing. Perfect for when you bake animation and want your clean keys back.

- Copy key positions from controls.
- Paste timing back after baking.
- Preserve your original key structure.

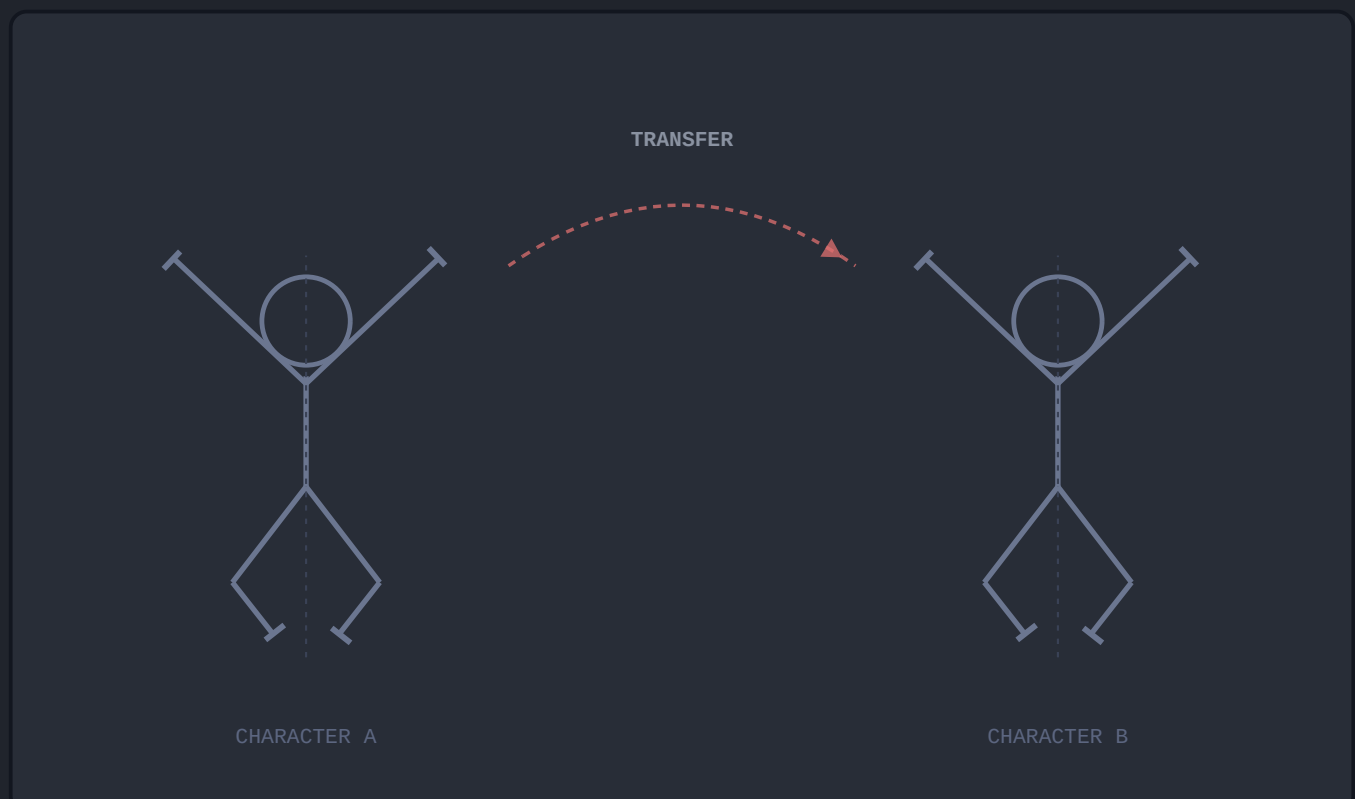

Fast Merge AnimLayers

Merge animation layers 10-50x faster than Maya's native tool. A must-have for animation layer workflows.

- Blazing fast layer merging.
- Smart merge preserves key timing.
- Works with selected or all layers.

TRANSFERRING ANIMATION

02

Selection, Tween & Arcs

Build selection sets, blend poses, and check motion quality.

Selection Sets

Create powerful, color-coded selection sets. Export and reuse them across different animations.

- Organize controls with color coding.
- Export sets for other scenes.
- Never recreate sets again.

Anim Sliders

Powerful animation sliders including Tween Machine, Blend to Neighbor, and more. Works great with Graph Editor and Channel Box selection.

- Tween between keyframes smoothly.
- Blend values to neighboring keys.

Arc Tracker

A lightning-fast arc tracker that won't slow down your scene, even on heavy rigs.

- Visualize motion arcs in real-time.
- Much faster than Maya's native tracker.
- Essential for polishing animation.

TIMING CHART

Powerful tools for adjusting poses and spacing faster, in the viewport and the Graph Editor alike.

Temp Controls

An awesome toolset for space-switching and temporary animation controls. Play around and discover new workflows!

- Create temporary animation controls.
- Space-switch without losing poses.
- Flexible workflow for any rig.

Xform - Align

Two powerful tools in one! Xform stores world positions and applies them back after space changes. Align matches objects to a target's transform.

- Xform: Store and restore world positions.
- Great after switching control spaces.
- Align: Match position/rotation to target.

Attributes Space Switcher

Change the space of your controls without losing animation. Also helps find the best rotate order to avoid gimbal lock.

- Switch spaces seamlessly.
- Preserves all your animation.
- Optimize rotate order automatically.

Temp Pivot

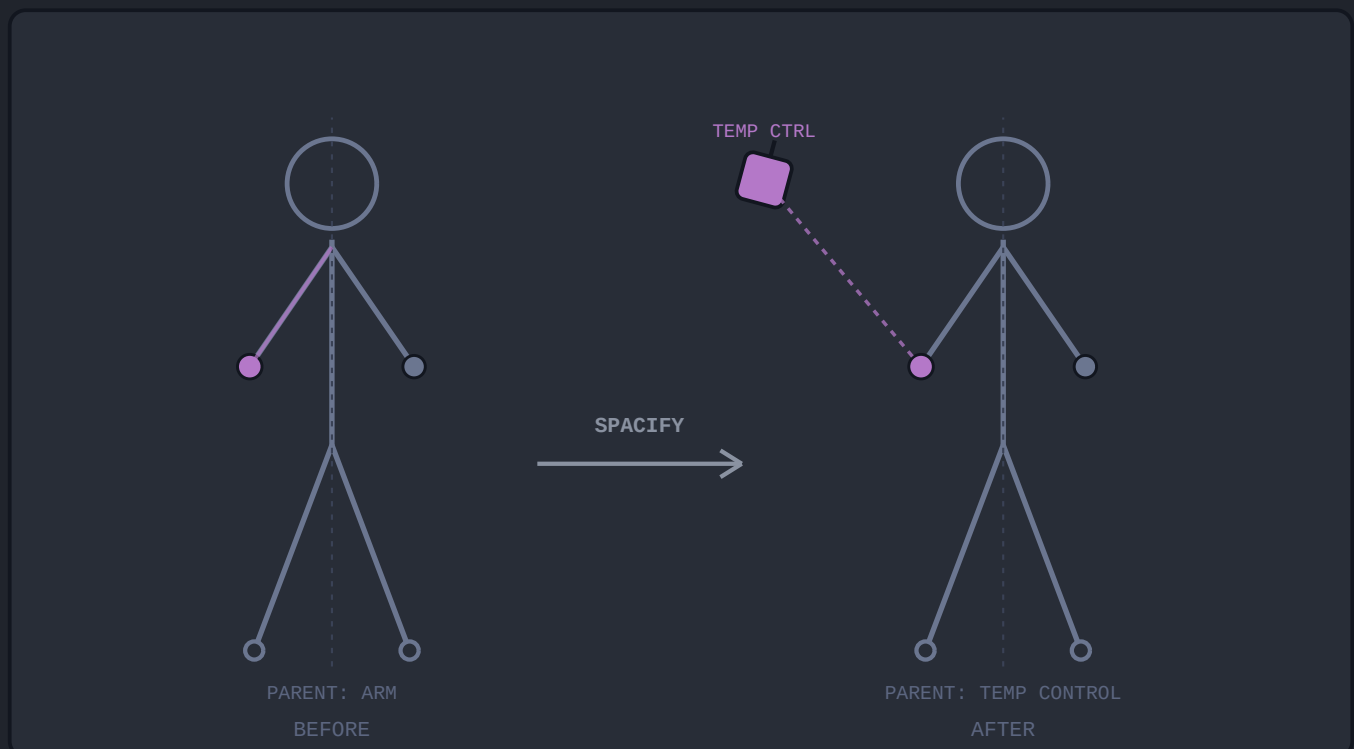

Change the pivot point of your current pose without breaking the animation. Perfect for rotating entire characters from a custom pivot point.

- Adjust pivot for current pose only.
- Rotate characters from any point.
- Grab world controls for full body rotation.

One of Animo's most powerful features, Spacify is a collection of space-switching tools designed to simplify technical animation workflows.

- **World**
Move and animate controls freely in world space.
- **New Pivot**
Instantly create a temporary pivot anywhere.
- **Relative**
Create a temporary parent while preserving your animation.
- **World Orient**
Keep world orientation while following another object's translation.
- **Camera Space**
Parent controls to the camera for precise screen-space animation.
- **Group**
Temporarily group multiple controls together.
- **Aim**
Make a control continuously aim at another object.
- **Temp IK**
Quickly generate a temporary IK setup from an FK chain.
- **FK Chain**
Convert independent controls into a temporary FK chain.

SWAPPING CONTROL SPACES

05

Xform & Align

How Animo's transform-copying and alignment tools work.

● Xform

Copies an object's position and rotation in world space so you can paste it back later. Works on a single frame or a whole range and can paste onto the same object or different ones. Used to snap something back to a saved pose or transfer a pose from one object to another.

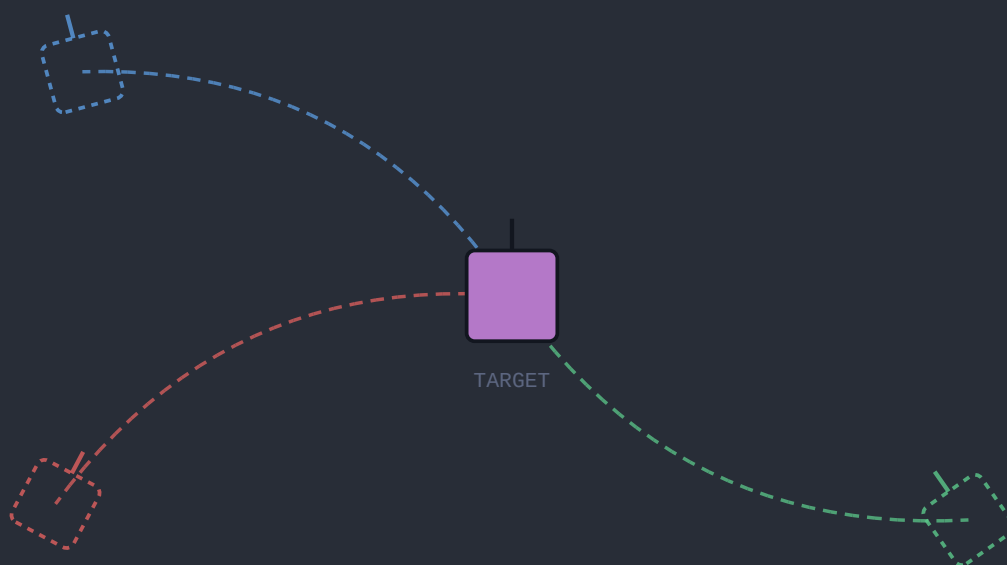

● Xform Relationship

It's like a fake constraint without actually constraining. Links a group of objects to one "driver" object and remembers their relative offsets. When you paste or bake, the other objects follow the driver's current position while keeping that offset. Used to make props or accessories follow a control without parenting them.

● Align

Snaps the selected objects to match the last-selected object's position and rotation pivot. Used to line up controls or props to a target, or to keep them lined up across a whole animation.

S N A P T O T A R G E T

Every object's position + rotation snaps to match the target's transform

Global Offset

Quickly offset poses for an entire range or selection. Like animation layers, but faster and without the merge cleanup.

- Offset entire pose ranges.
- No layer merging needed.
- Keeps your keyframes clean.

Twosify

Make your splined animation look stepped without destroying your curves. Attach to camera space for that Spider-Verse style!

- Stepped look, splined data.
- Camera-space attachment option.
- Perfect for stylized animation.

Vectorify

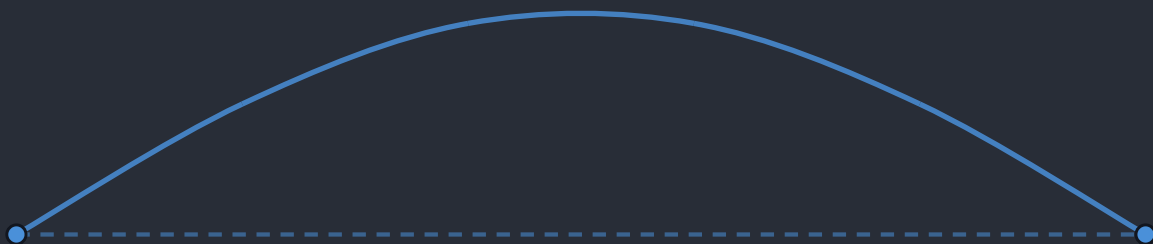

A powerful tool for repathing animation while keeping feet locked to the ground. Your planted feet stay solid throughout the repath.

- Repath motion trajectories.
- Maintains planted feet positions.
- Perfect for redirecting locomotion.

VECTORIFY — PLANTED FEET

Redirect the path however you like, feet stay locked to the ground

AFTER — REPATHED

BEFORE — ORIGINAL PATH

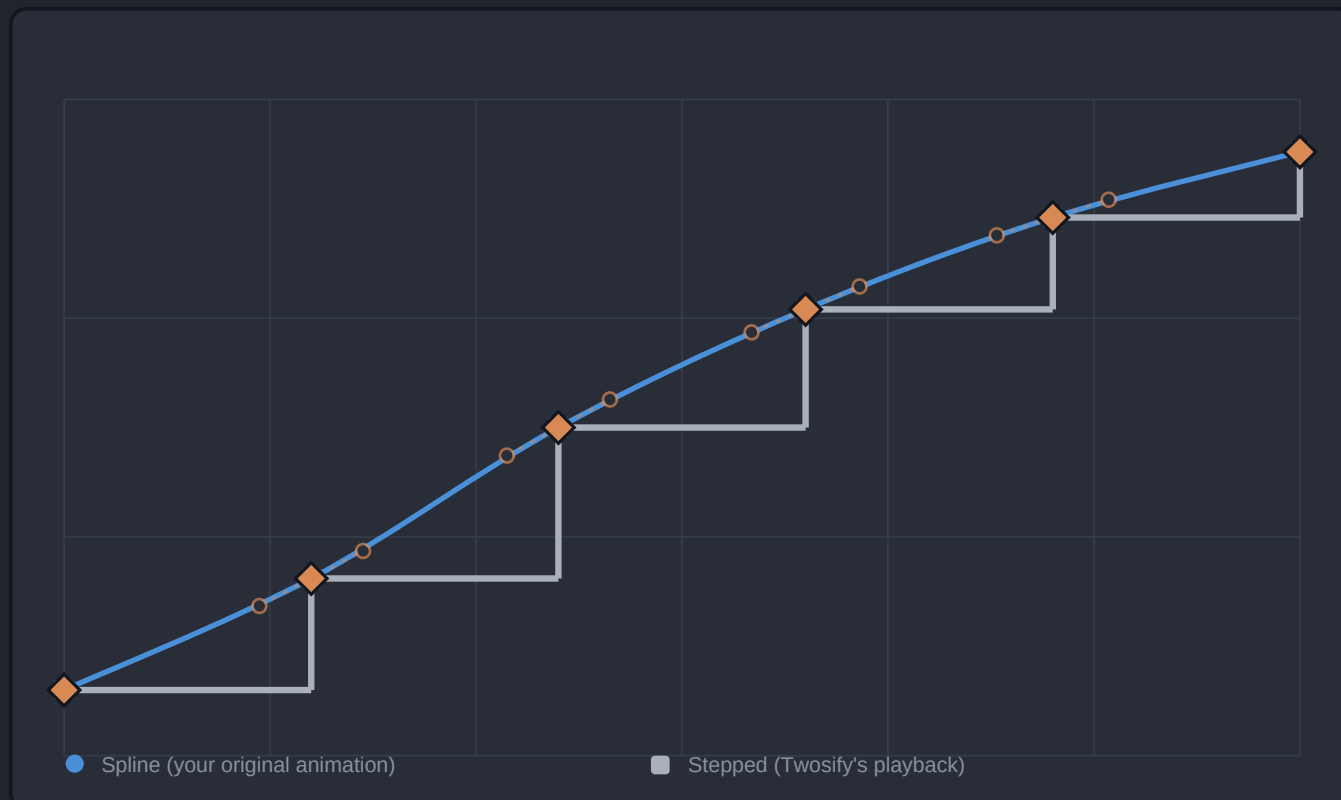

Convert your animation to stepped in a non-destructive way without losing your splines and clean keys.

CAMERA ATTACHMENT

- Attach your animation to the camera without losing your poses.
- Animate the camera attachment on and off easily.
- Going back to blocking even during Polish is easy now.

HOW STEPPING WORKS

Twosify isn't limited to even twos. Hold each pose for as many frames as you want, in any pattern. Stepping is a display of your curve, not a replacement for it, the spline stays fully intact underneath, so your polished animation is never lost.

Vectorify makes it easy to repath animations. It works seamlessly with cycles for bipeds and quadrupeds, but it's not limited to cycles. You can repath any animation in just a few clicks.

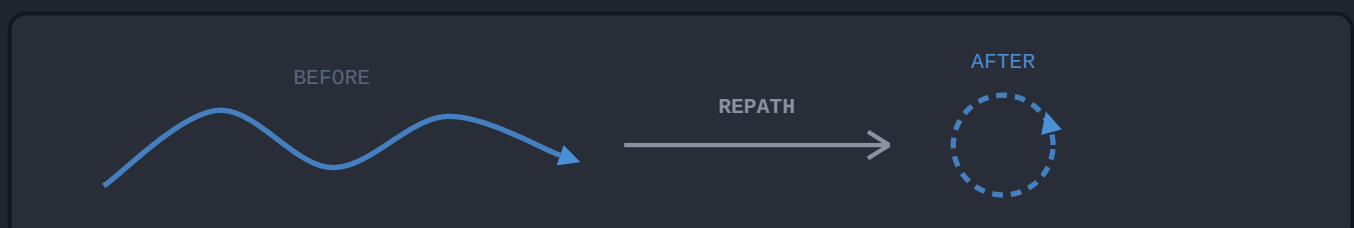

FEATURES

- Repath animations easily with temporary controls.
- Snap animations to the ground, even on slopes, bumps, or uneven surfaces.
- Turn bipeds or quadrupeds in circles or any shape naturally.
- Straighten a curved path.
- Flip the animation direction instantly.
- Snap your path to another path instantly.
- Change the pivot point on a curve.
- Flexible Master Control. Choose whether it follows your character or stays independent with just a few clicks.
- When satisfied, bake your result instantly and add your finishing artistic touches.

EXAMPLES

- Easily create a circular animation.
- Snap your animation to the ground surface with one click.
- Update your animation with a new surface any time you want.
- Reverse your path.
- Snap your path to another path.
- Make your curved path straight with one click.
- Make the Master control follow your character.
- Make the Master control NOT follow your character.

REPATHING A WALK

09

Tangents

Set curve interpolation across all keys or a selection.

Auto Tangent

Set curve tangents to Auto mode for smooth, natural interpolation between keyframes.

- All Keys: Apply to entire animation.
- Selected: Works with timeline or Graph Editor selection.
- Creates flowing, organic motion.

Linear Tangent

Set curve tangents to Linear mode for constant-speed, straight-line motion between keyframes.

- All Keys: Apply to entire animation.
- Selected: Works with timeline or Graph Editor selection.
- Even spacing with no ease in/out.

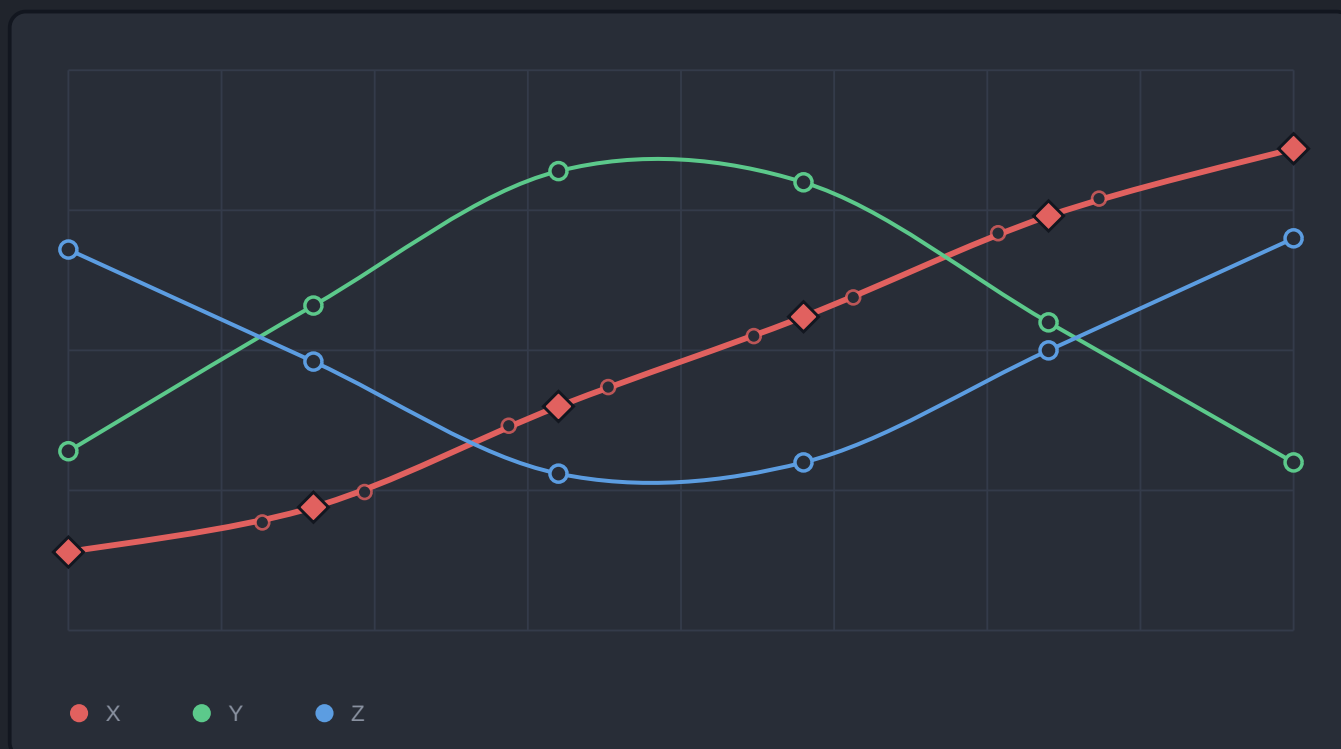

Step Tangent

Set curve tangents to Step mode for instant value changes with no interpolation between keyframes.

- All Keys: Apply to entire animation.
- Selected: Works with timeline or Graph Editor selection.
- Perfect for blocking and pose-to-pose workflow.

CURVE EDITOR

Quick Exporter

Export selected objects and quickly import them into another Maya scene. Perfect for transferring assets between files.

- Fast object export/import.
- Great for layout artists.
- Streamlines asset transfer.

Mirror Animation

Mirror the pose on your selected controls. If a range is selected, the entire range gets mirrored.

- Mirrors the current pose instantly.
- Selected range mirrors all keys in it.
- Great for animation cycles.

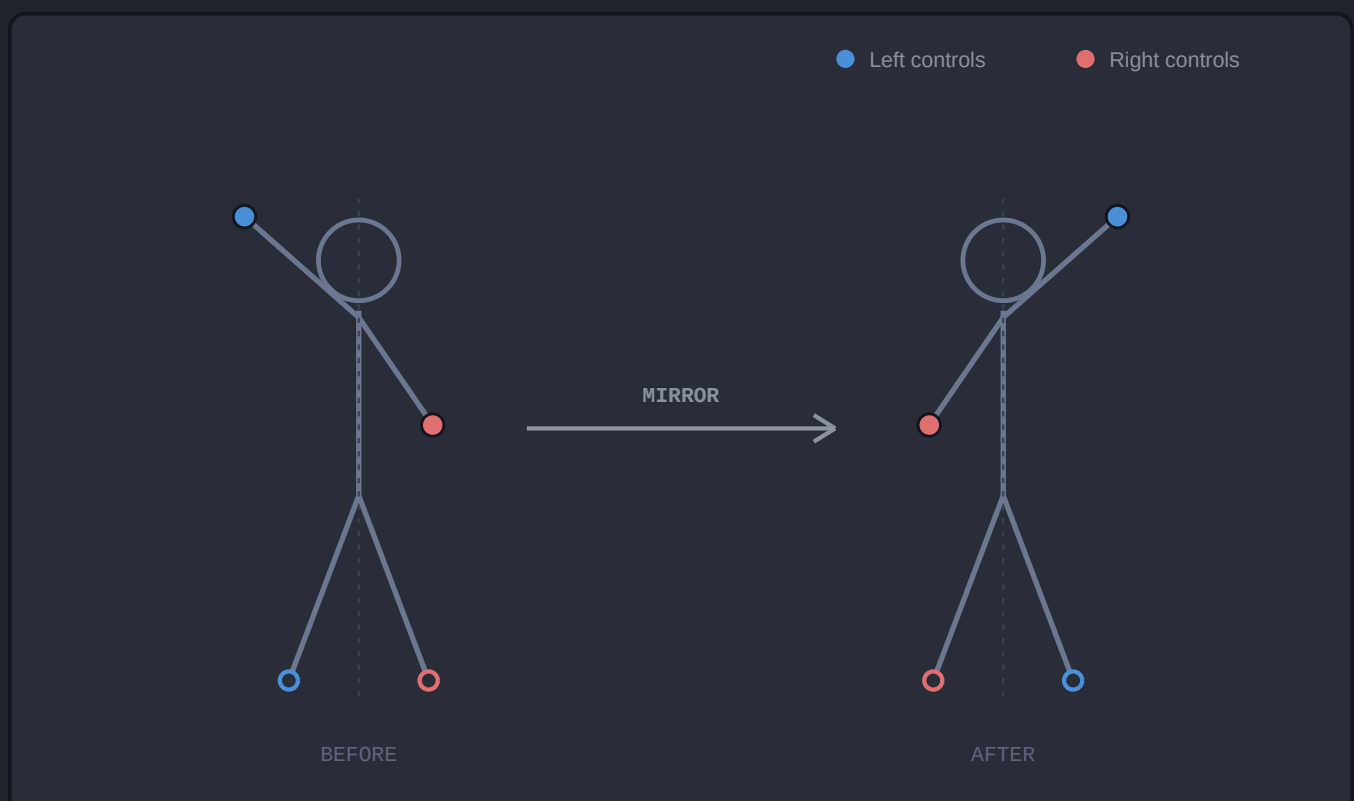

Multi-View Playblaster

Playblast multiple camera views at once with a single click. Perfect for checking animation from different angles.

- Capture multiple views simultaneously.
- Great for review sessions.
- Export to your editing software.

M I R R O R A N I M A T I O N

11

Pose & Key Utilities

Everyday actions for resetting, baking, sharing and selecting keys.

Reset Pose

Reset selected controls to their default pose. Works with Timeline, Graph Editor, and Channel Box selection too!

- Resets translate, rotate, and scale.
- Respects default attribute values.
- Works with custom attributes.

Fast Bake

Bake your animation 10-50x faster than Maya's native bake. Choose your stepping interval from the menu.

- Lightning fast baking.
- Multiple step options (1s to 7s).
- Removes constraints after baking.

Share Keys

Add keys on all keyframe positions across your timeline with one click. Works with Timeline, Graph Editor, and Channel Box selection.

- Select controls to share keys.
- Keys added without changing values.
- Great for syncing timing.

Select Opposite

Instantly select the opposite side controls. A hotkey is highly recommended for this one!

- Left to Right, Right to Left.
- Works with most rig naming conventions.
- Essential for mirroring workflows.

Crop Animation

Keep only the keys within your selected range and remove everything outside. Clean up made easy!

- Uses playback range start/end.
- Preserves keys within range.
- Perfect for trimming clips.

Delete Redundant Keys

Remove static keys and flat curves that aren't doing anything. Essential for cleaning up baked animation.

- Deletes keys with identical values.
- Removes flat animation curves.
- Optimizes your scene.

Smooth Selected Keys

Smooth out jittery animation curves like butter. Perfect for cleaning up mocap or noisy keyframes.

- Removes unwanted jitter.
- Preserves overall motion.
- Works on selected keys.

Smart Snap Keys

Snap keys to whole frames intelligently. Much smarter than Maya's native tool - won't break your poses!

- Removes sub-frame keys.
- Preserves pose integrity.
- Handles compressed keys gracefully.

About Animo

Information about Animo, version details, and credits.

Animo Settings

The settings hub for Animo. Resize the toolbar UI, find extra tools in the Tool Editor, and fine-tune other preferences.

- Resize and reposition the Animo UI.
- Access extra tools via the Tool Editor.
- Adjust other Animo preferences.

14

Animation Sliders

Drag-to-apply sliders docked in the Animo toolbar for real-time key adjustments.

● Tween Machine	Easily create breakdowns between your poses. Slide to blend toward the previous or next keyframe.
● Blend to Neighbor	Blend your current pose or selected keys toward neighboring keyframes. Perfect for fine-tuning spacing and favoring poses.
● Scale Keys	Scale your selected keys using neighboring keyframes as pivot points. Right-click to switch between Left, Right, and Average modes.
● Blend to World	Blend your selected object toward its neighboring keys in world space. Drag right to blend toward the next key, left to blend toward the previous one.
● Ease	Ease your pose in or out, softening the timing around the current keyframe. Shortcut: Ctrl+TW.
● Scale Right	Scale your selected keys using the key to the right as the pivot point. Shortcut: Shift+SL.
● Scale Average	Scale your selected keys using the average of the curve as the pivot point. Shortcut: Ctrl+SL.
● Blend to Default	Blend your selected keys toward the attribute's default value. Drag right toward default, left to push away from it.
● Time Offset	Offsets the animation without offsetting the timing. The more keys you have selected, the better the result.
● Time Offset Stagger	Offsets the animation like Time Offset, but staggers the amount based on the order you selected your objects. The first object selected offsets the most, with each object selected after it offsetting progressively less.
● Noise / Wave	Add a smooth wave to your selected keys by dragging right, or randomized noise by dragging left.
● Connect to Neighbour	Connects your whole animation curve to a neighboring keyframe, without breaking the rest of its motion. Best used in the Graph Editor.
● Push / Pull	Push or pull your selected keys relative to a straight line between their neighbors. Left aligns them linearly, right pushes them further out.
